UI/UX DESIGN SUBMISSION

1. Title of the Proposed System

EduReach: A Community Digital Literacy and Skill Assessment System

Desktop Application (JavaFX GUI) with MySQL Database · Supports UN SDG 4: Quality Education (Target 4.4)

EduReach helps community learning centers deliver structured digital skills courses, assess learners automatically, and issue verifiable records of competency, even without internet access.

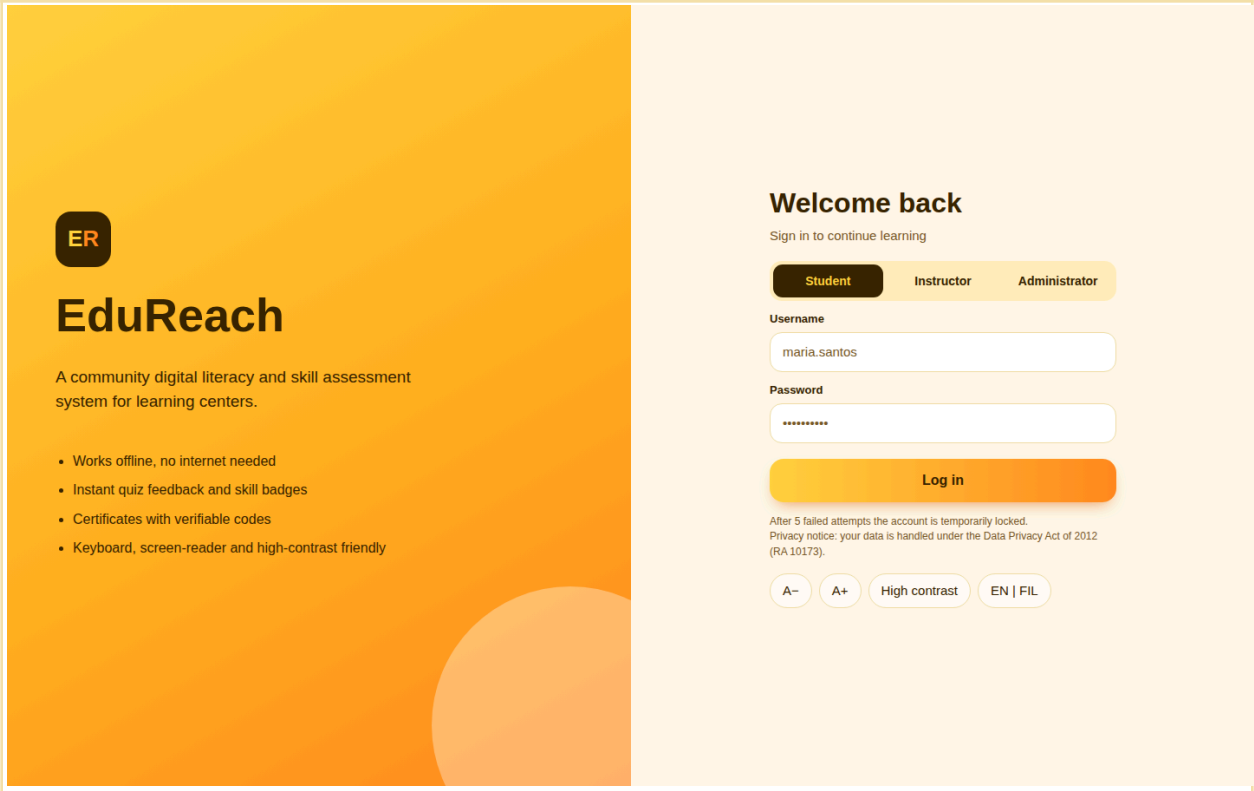

Proponents

Name	Role
Erese, Daniel Noel B.	Project Manager / System Analyst, UI/UX Designer and JavaFX Developer
Lantin, Gabriel Jose	Lead Programmer (Core OOP and Business Logic), QA Tester and Technical Writer
Escobar, Miguel C.	Database Designer / DBA (MySQL Schema and DAO Layer)

2. UI/UX Design and 3. Brief Explanation per Screen

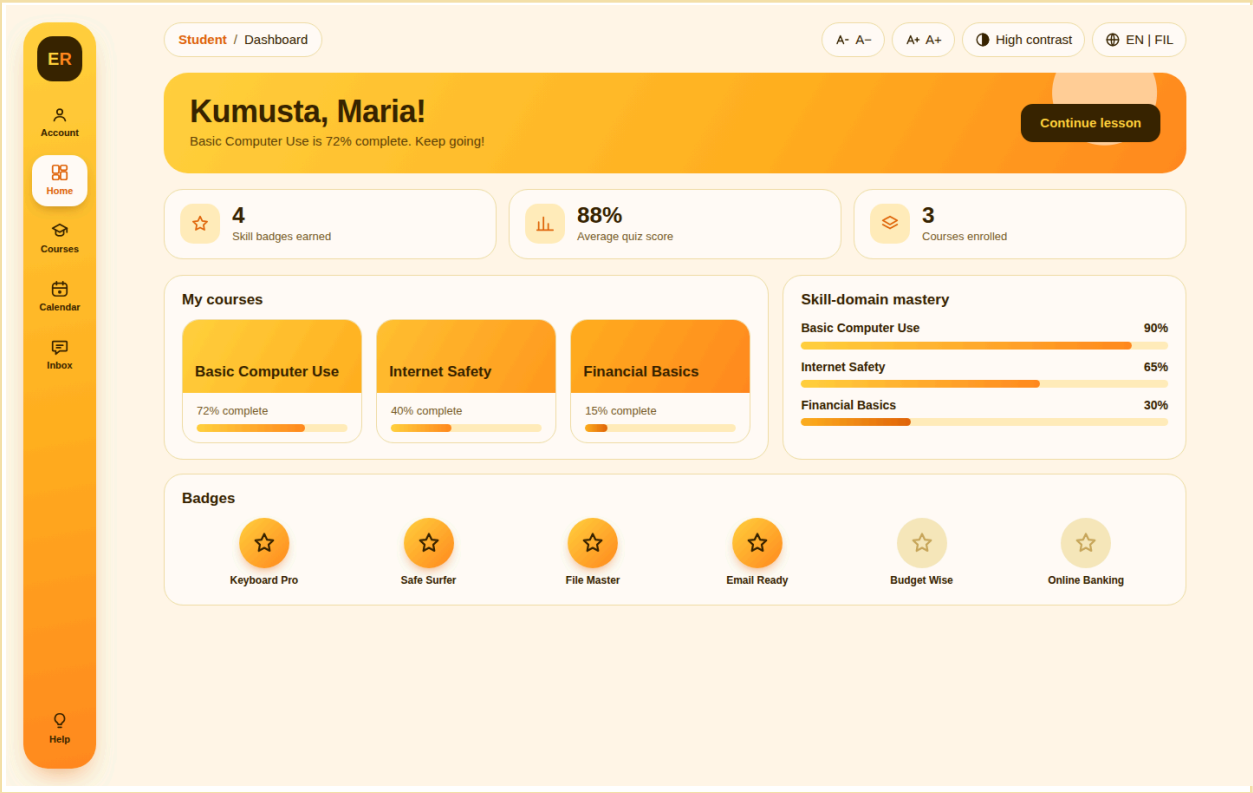

The screens below are arranged in the order a user would typically move through the system. Each screen is followed by a short explanation of its purpose and how it supports EduReach. The design uses a warm yellow to orange palette, large touch-friendly controls, text labels beside every icon, and accessibility options (font size, high contrast, English/Filipino) on every screen.

Screen 1: Login and Role Selection

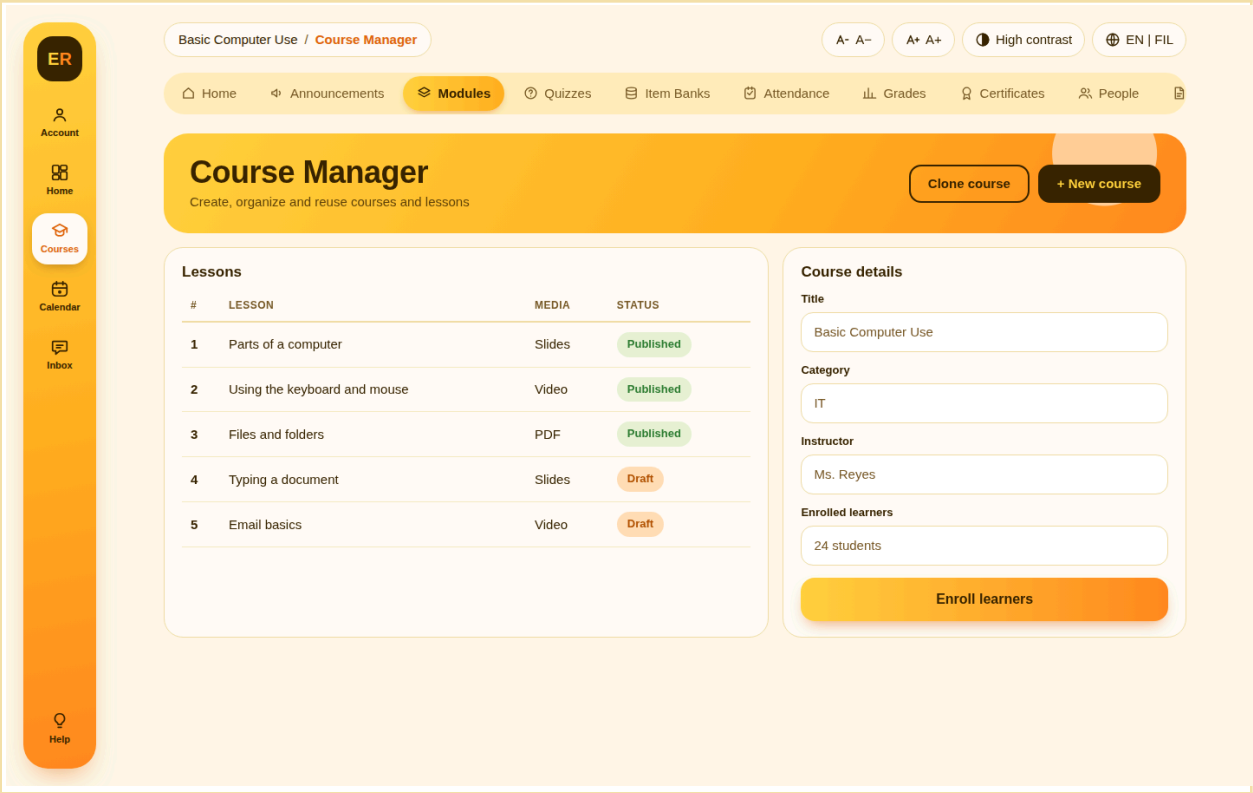

Explanation: This is the entry screen where Students, Instructors, and Administrators choose their role and sign in with a username and password. It shows the privacy notice, the temporary lockout rule after repeated failed attempts, and the accessibility options (font size, high contrast, English/Filipino). It supports secure, role-based access to the system.

Screen 2: Student Dashboard

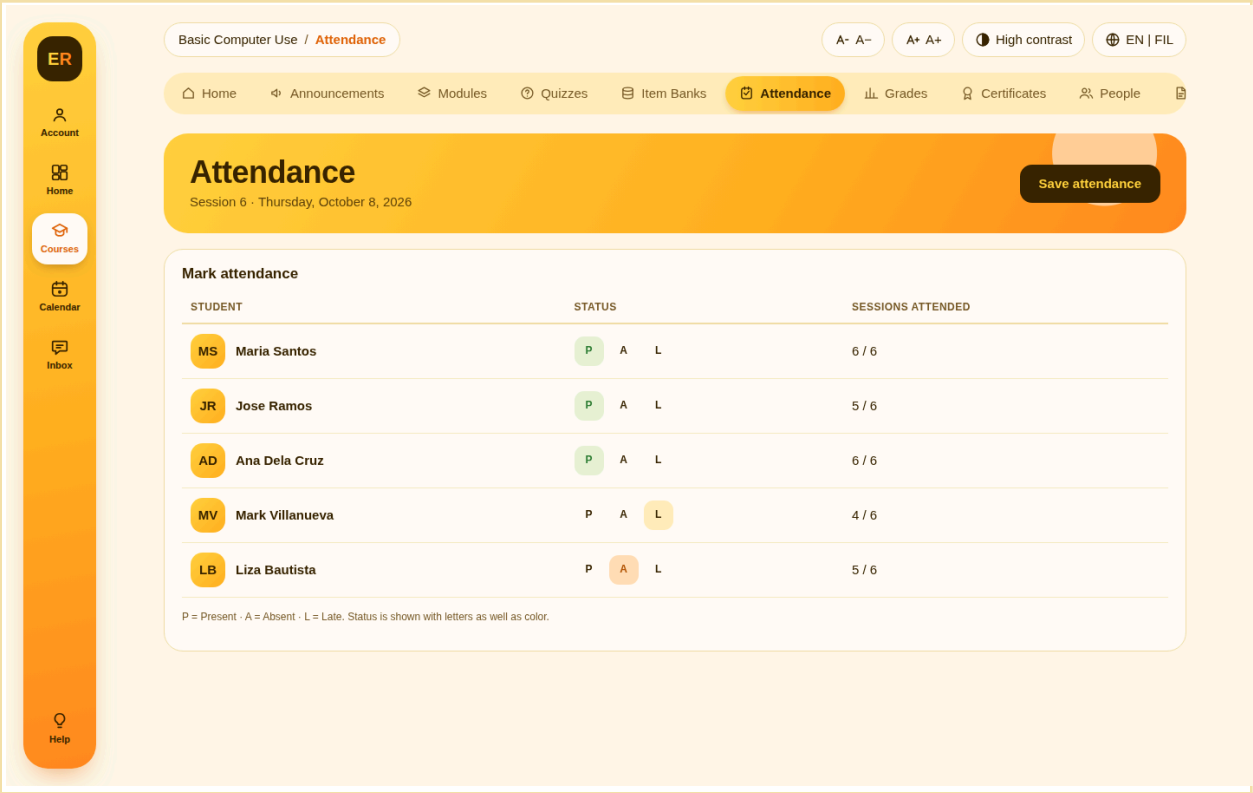

Explanation: The dashboard greets the learner and shows overall progress, average quiz score, earned skill badges, and enrolled courses. Learners can see their mastery per skill domain and jump back to the lesson they were working on. It supports competency tracking by letting students see what they have mastered and what still needs review.

Screen 3: Course Manager

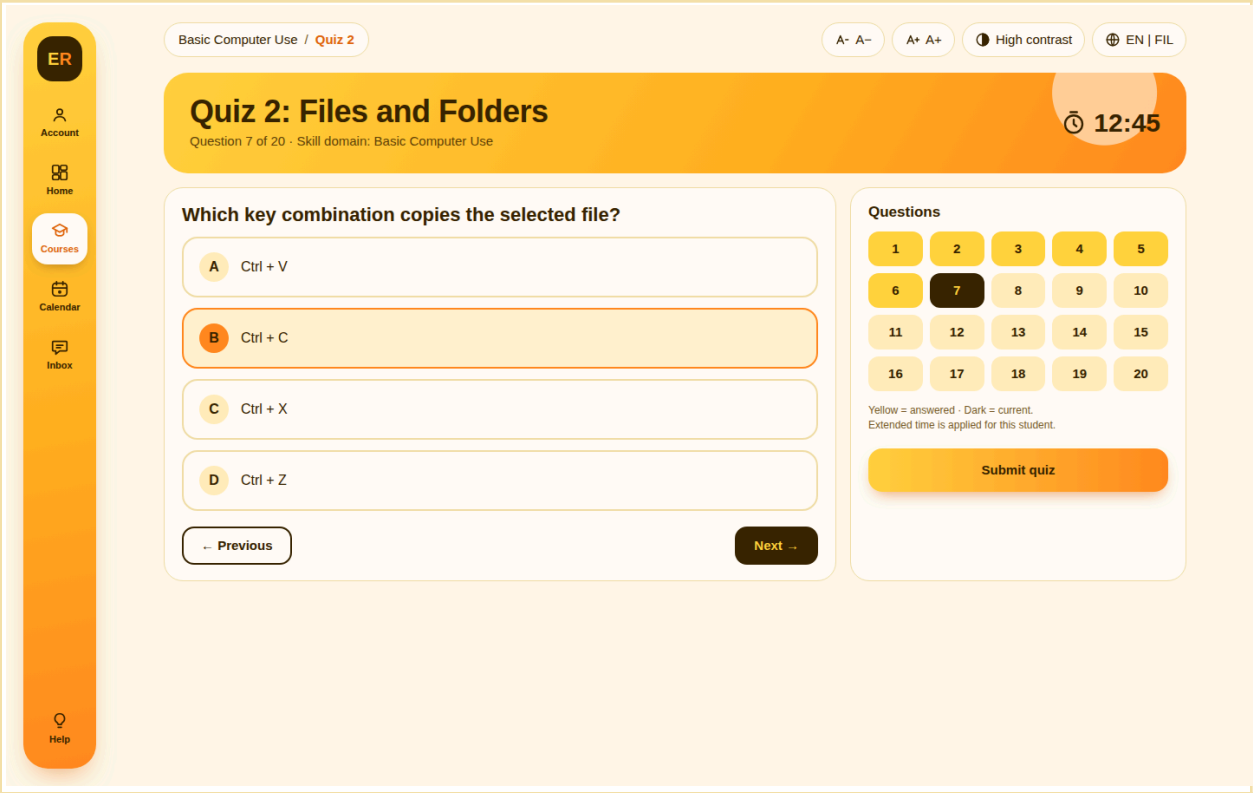

Explanation: Instructors use this screen to create, categorize, and organize courses and their lessons, including the type of learning media. They can edit course details, clone a course for reuse, and enroll learners. It centralizes learning materials so they stay available even when volunteer instructors change.

Screen 4: Attendance Recording

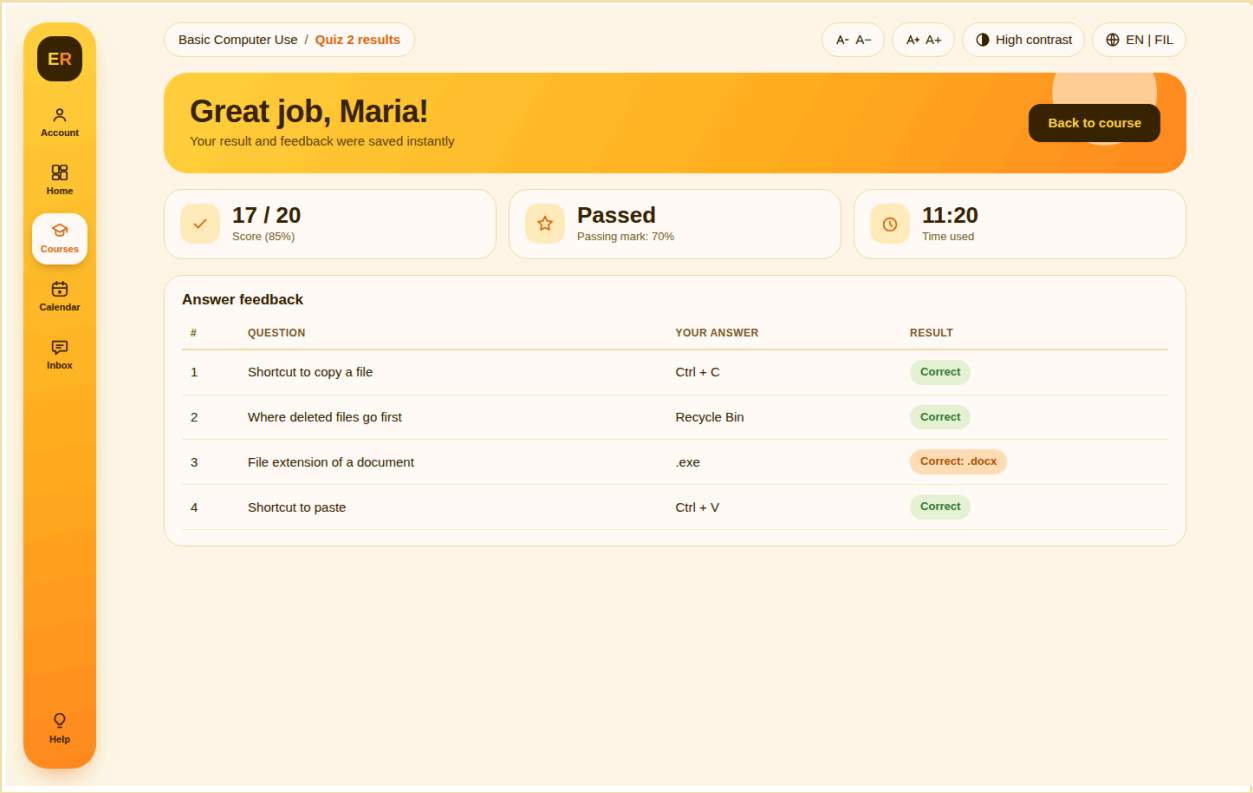

Explanation: This screen lets the instructor mark each learner as Present, Absent, or Late for a given session and save the record with one click. Statuses are shown with letters as well as color, and the total sessions attended are displayed per student. It replaces paper logbooks with a searchable digital attendance record.

Screen 5: Quiz Engine (Taking a Quiz)

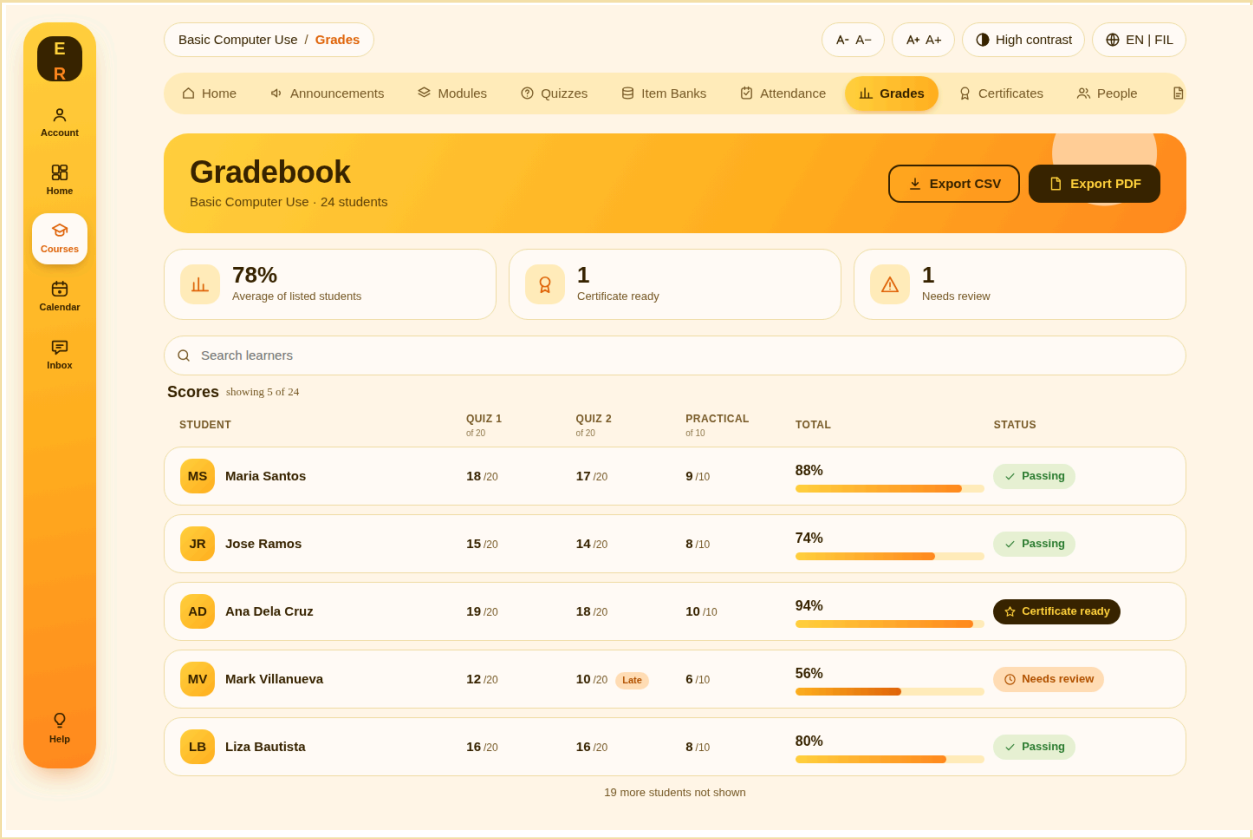

Explanation: Learners answer timed multiple-choice questions one at a time, with a visible countdown and a question navigator showing answered and current items. Extended time for learners who need accommodations is indicated on the screen. It supports standardized, automatically scored assessment that is accessible to all users.

Screen 6: Quiz Results and Instant Feedback

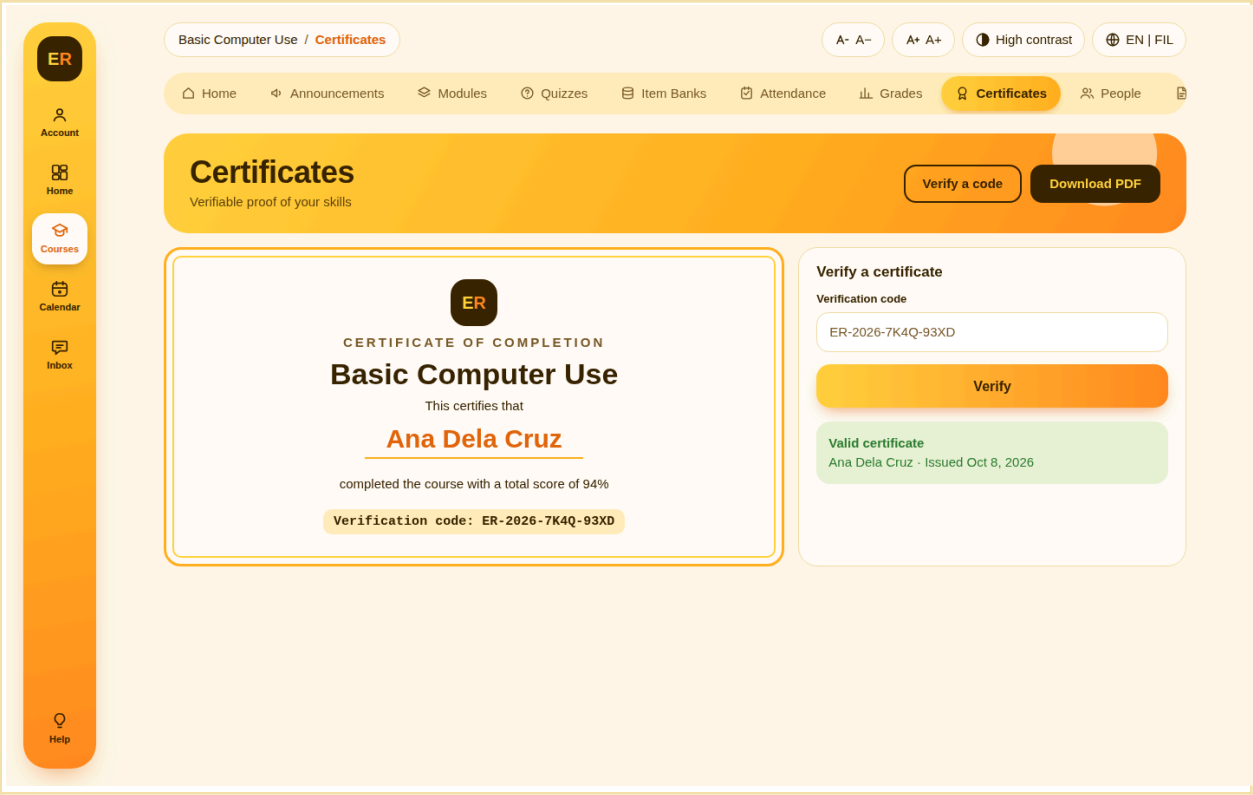

Explanation: After submitting, the learner immediately sees the score, pass or fail result, and time used, plus feedback on each answer with the correct answer shown. This helps learners understand their mistakes right away. It supports fast, consistent assessment without the delays of hand-checking.

Screen 7: Class Gradebook

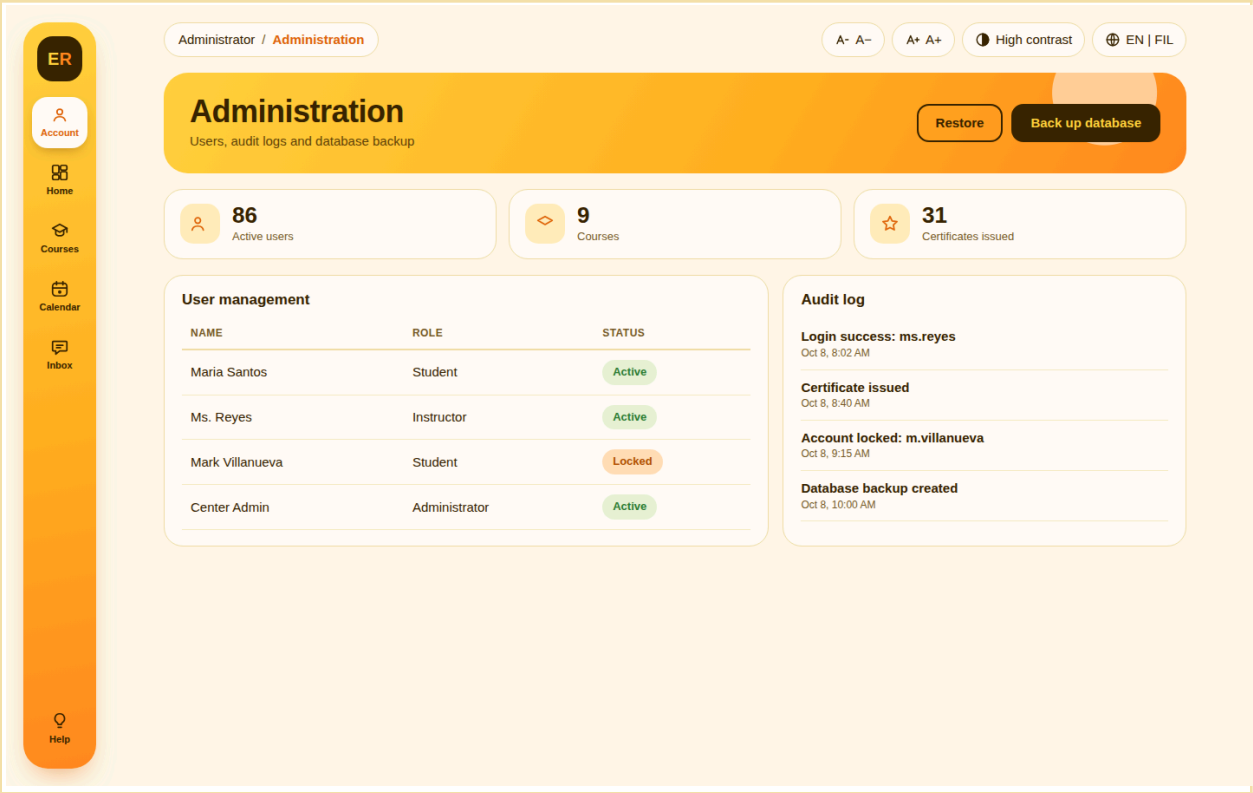

Explanation: Instructors can review every student's quiz scores, practical score, total percentage, and status (such as Passing, Needs review, or Certificate ready) in one place. They can search for a learner and export the gradebook as CSV or PDF. It removes manual encoding of scores and gives a ready-made report of class progress.

Screen 8: Certificates and Verification

Explanation: This screen shows a learner's PDF certificate with a unique verification code and lets them download it. Staff or employers can enter a code to confirm that a certificate is valid and see who it was issued to. It gives learners reliable proof of their digital skills that can be checked.

Screen 9: Administration

Explanation: Administrators manage user accounts, view center-wide totals, review the audit log of logins and privileged actions, and back up or restore the database. Locked or inactive accounts can be identified quickly. It supports data security, accountability, and dependable record keeping for the learning center.
